

Hariwan Ashram Carpool — Product Plan (v1.1)

One line: A simple ride-share board for one route only — Tricity (Chandigarh / Panchkula / Mohali / Zirakpur) ⇄ Hariwan Ashram. No payments, no chat, no tracking. Post a ride, request a seat, connect by phone.

1. Account & Login

- **Login with Google only.** No passwords to remember, no OTP infrastructure to maintain.
- At first login, a short **complete-your-profile** step. Mandatory: **Phone number, Photo** (take with camera or choose from gallery), Name (pre-filled from Google), Gender. Optional: "I am an Art of Living teacher" (yes/no).
- User cannot post or request rides until phone + photo are in. Photo builds trust — riders see who is driving, drivers see who is asking.

2. Core Features

1. **Post a ride (with return, one screen)** — Going and return are captured on the *same screen* in one flow:
 - **Going:** Direction is fixed (To Ashram), Date, Departure time, Pickup point (map pin + short address), Seats.
 - **Return section (toggle, ON by default):** "Also posting my return ride?" When ON, it shows just 3 fields — Return date (defaults to same day), Return time, Seats (can differ). Drop-off **defaults to the same Chandigarh pickup point** — one tap to change if needed. When OFF, nothing else is asked.
 - One toggle for the whole post: "*Show my phone number publicly on the listing?*"
 - On submit, the system creates **two separate rides** internally (going + return). They are listed, managed, and cancelled independently — the user just never feels that.
2. **Browse rides** — List filtered by direction and date. Each card shows: driver **photo**, name, gender, teacher badge (if any), time, pickup area, seats filled/total, and phone number (only if driver chose public).
3. **Request & approve** — Rider taps *Request Seat* → driver sees the rider's photo, name, gender → taps *Approve* → **phone numbers are shared both ways**. All coordination happens offline on phone.
4. **Manage my ride** — Driver can approve/decline requests and can mark **"Ride Full"** anytime (covers offline bookings). Rider can **cancel** their seat anytime; the seat frees up. A driver who skipped the return earlier can post it later as a normal ride (direction: From Ashram).
5. **Contact admins** — A clearly visible **"Contact Ride Admins"** on the main screen (phone number + WhatsApp tap-to-call). For confusion, disputes, or urgent help.
6. **Admin dashboard (web)** — All rides, all requests, and especially **requests pending too long** (with driver's phone, so admins can call and follow up). Basic user list. SMS/email reminders come later.

3. Screens (7 total)

#	Screen	Purpose
1	Login	Google sign-in only
2	Complete Profile	Phone, photo (camera/gallery), gender — first login only
3	Home	Find a Ride / Offer a Ride buttons; upcoming rides below; Contact Ride Admins visible
4	Post Ride	Going + return in one screen; return toggle ON by default
5	Ride List & Detail	Filter by direction + date; ride cards; Request Seat
6	My Rides	<i>Offered</i> tab (requests, approve, Mark Full) and <i>Requested</i> tab (status, Cancel)
7	Admin Dashboard (web)	Rides, pending requests, users

4. User Journeys

Driver (car owner) Google login → add phone + photo once → Offer a Ride → fills going details → return section already open with same-day, same-point defaults → adjusts return time and seats → submits once, two rides go live. Later: request arrives → sees rider's photo and details → Approve → numbers exchanged → coordinate on phone. Car fills up offline → **Ride Full**.

Rider Google login → add phone + photo once → Find a Ride → pick date & direction → sees "Ramesh (photo), Male, Teacher, 7 AM from Sector 17, 2/4 seats" → Request Seat → on approval gets driver's number → calls, confirms pickup. Plans change → **Cancel**, seat opens up.

Admin Opens web dashboard → this Saturday: 12 rides, 40 seats, 28 filled → 3 requests pending over 24 hours → calls those drivers → done. Also receives direct calls via the Contact Admins link on the app.

5. Deliberately NOT in v1

Payments, in-app chat, live location tracking, ratings/reviews, multiple routes, matching algorithms, push-notification campaigns.

Decision needed today: approve this feature set → then tech approach and timeline.
